chiavette unificate

Chiavette Unificate sells its products worldwide and is located in Italy close to Bologna.

The Company started its activities in 1952: since then Chiavette always tried to follow the requirements and the developments of this sector and offers products that made and continue to make the history of the Company. From the craft stage during the first years to the industrial production based on high technology, we manufacture mechanical components, which are necessary for the motion of different systems and machineries. The company focuses on continuous improvements, consolidated management and production systems, details accuracy, the central role of people, quick innovation, and service efficiency; these values enable us to reach the customer's trust and transparency.

That's why we are **"together in movement"**. We're moving with you: we widened our range of products dedicated to our customers. Among our product range we have the Tescubal rod ends and spherical bearings (steel-bronze or steel-steel coupling), the Tesno rod ends and spherical bearings (steel-PTFE coupling), which are high resistance solutions, self lubricating and able to guarantee excellent performances even in case of heavy applications; the ball joints, axial joints and self aligning joints; the clevises and their accessories; the keys; the rod assemblies... Several solutions made of mild steel, stainless steel and aluminium. On the other hand special solutions and according to drawings can be easily supplied and managed, delivered directly to the customer's production line.

We always want to give you the right products according to your requirements and a dynamic service, which enables you to save time and money.

All together, these are the strengths of Chiavette Unificate

In our catalogue you can find our complete range of products, which are manufactured according to our Quality System certified by TÜV. You can deepen these informations visiting our web site www.chiavette.com, so that we can better know each other and work together, since the people of Chiavette Unificate S.p.A. will surely move with you.

A Company Certified According to UNI EN ISO 9001:2015

ELECTROLYTIC COATINGS

This chapter specifies the characteristics required by electrolytic zinc coatings applied on components manufactured by Chiavette Unificate in carbon or tied steel, whose main purpose is to protect against corrosion, classify the types of coating, indicating the criteria of choice and prescribing the information to be put in the drawing.

The following tables are in accordance with the contents of ISO

COATING DESIGNATION CODE		ALTERNATIVE DESIGNATION	THICKNESS [μm]	CHROMATE TREATMENT	RESISTANCE IN SALT SPRAY	
					WHITE RUST [h]	RED RUST [h]
Fe/Zn	5c1A	A2J	5	A	6	24
Fe/Zn	5c1B	A2K		B	12	36
Fe/Zn	5c2C	A2L		C	48	72
		A2L CrIII				
Fe/Zn	5c2D	A2M		D	72	96

Description of the main designation (Fe/Zn 8c1A):

CLASS	DESIGNATION	TYPE	CHARACTERISTIC APPEARANCE	CORROSION PROTECTION
1	A	clear	Transparent, clear, sometimes with bluish tone	Low, for example against the formation of spots from handling or against high humidity in mildly corrosive conditions
	B	white	Transparent and slightly iridescent	
2	C	Iridescent	Iridescent yellow	High, including protection against certain organic vapors
	D	Opaque	Olive green with brown or bronze tones	
	Bk	Black	slightly iridescent Black	Different grades of protection against corrosion

Alternative designation example: A3J

A METAL/COATING ALLOY			3 COATING THICKNESS			J FINISH AND CHROMATE TREATMENT		
DESIGNATION	SYMBOL	ELEMENT	DESIGNATION.	COATING THICKNESS [μm]		DESIGNATION.	FINISH	CHARACTERISTIC APPEARANCE
A	Zn	Zinc		1 metal coating	2 metals coating	J	Bright	No color
			2	5	2+3	K		from bluish to bluish iridescent
			3	8	3+5	L		from yellowish reflex to iridescent yellow brown
			4	12	4+8	M		from opaque olive to olive brown
						S	Semi-bright	from brown-black to black

Designations 1A – 1B – 2C CrIII are Chrome VI free according to European Community Directives: 2002/95/EC concerning the restriction of certain hazardous substances in electrical and electronic devices (Directive RoHS); 2002/96/EC about waste of electrical and electronic devices (RAEE).

Other types of protection coatings

Iron-zinc alloy: Black alkaline zinc-iron alloy process

This minimum 8 micron thickness treatment guarantees a resistance to salt corrosion (ASTM B117) up to:

500 h to iron corrosion and up to 250 h to white oxide, for black color;

700 h to iron corrosion and up to 400 h to white oxide, for yellow color

Zinc-Nickel alloy: The process of Zn.Ni alloy (12-16% nickel content) guarantees the max. resistance to corrosion, applying few micron thickness, even in case of high temperatures (up to +200 C). Process of Zn.Ni alloy, black or grey color.

This process is complying with the EU Directives 2000/53/EC (RoHS), 2002/96 (WEEE) and guarantees a resistance as requested by the automotive sector specifications. To increase the resistance, it is possible to apply a sealer after the coating.

CHROMITING: Passivation for zinc electrolytic plating treatments and zinc alloys. This process is complying with the EU Directives 2000/53/EC (RoHS), 2002/96 (WEEE), slightly iridescent, with high resistance to corrosion.

Up to 400 hours in salt spray with 7um thickness, without white rust (ASTM B117) and without any need of a sealer. The thermal shock does not adversely affect corrosion resistance (test performed for 8 hours at 120).

Chromiting far exceeds the standard achieved by conventional hexavalent chrome yellow and green.

Chromiting is the process that had the largest number of awards in the automotive sector and which has the most use on an industrial scale.

To increase the resistance it is possible to use a sealer.

Sealing: The sealers can be applied to the passive layers after the processes of galvanizing and zinc alloys. They increase the resistance to corrosion.

NIPLOY PROCESS: The Niploy process is an exclusively chemical Nickel plating process with an high content of phosphorus, which allows to obtain a uniform deposit on treated surfaces, non-porous and highly resistant to corrosion and wear.

The deposit which arises from the Niploy treatment process ensures, thanks to the structure of the carry and the presence of phosphorus, a high resistance to corrosion, making it usable in application areas as pharmaceuticals and food, instead of stainless steel.

DACROMET®: DACROMET® is an inorganic coating based on zinc and aluminium flakes in a chromium binder. The anticorrosion performances are particularly high in case of thin treatments (from 5 to 10 m). DACROMET® is the reference technology concerning threaded fasteners for the automotive industry.

GEOMET®: Il GEOMET® is a water-based coating, composed of zinc and aluminium flakes in an inorganic binder. It is chromium free (neither Chrome VI nor Chrome III).

1. INTRODUCTION

The rod ends and spherical bearings are mechanical junctions which, because of their internal geometry, are particularly suited for the transmission of static and dynamic forces, together with rotary, oscillatory and tipping movements.

They are standard products which are produced in accordance with ISO 12240-4 Series K and ISO 12240-1 Series K respectively.

The project takes into account the ever more stringent requirements of the market which calls for a reduced clearance, remaining constant with time, and completely maintenance free operation.

2. CHOICE OF ROD ENDS AND SPHERICAL BEARINGS

In order to make the appropriate choice of rod ends or spherical bearings it is important to know what their real application will be.

The type of load applied, static or dynamic, will be decisive for the correct dimensioning of the rod end or the spherical bearing.

Static Load

The static load means the maximum radial or axial load applied to the rod ends or spherical bearings in a static way, without oscillations or rotations, at room temperature, that does not cause permanent deformations or does not endanger its functionality.

The values of the maximum acceptable load were obtained by calculations and then checked on considerable samplings taken from our mass production.

Radial Static Load

The maximum acceptable radial static load for rod ends and spherical bearings is the one indicated on the dimensional table.

Axial Static Load

For the rod ends the maximum axial static load should not exceed the axial holding load of the joint on the head (table 1). Furthermore, it should be calculated basing on the length of engagement of the thread for the male type and on the male resistance connected to the female type.

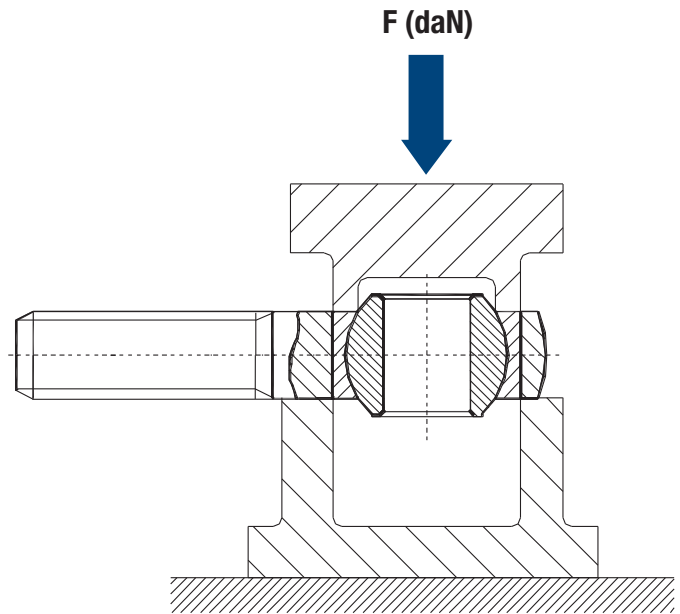

For the spherical bearings the maximum acceptable axial static load is the one indicated in the dimensional tables.

INNER RING HOLE DIAMETER	LOAD (daN)
5	100
6	120
8	170
10	200
12	270
14	400
16	550
18	580
20	600
22	700
25	800
30	1200
35	1400
40	1650
50	2000

Table 1

Axial holding load of the rod end

In case of dynamic load (load with relative movement between the inner and outer ring) it is necessary to carry out the following tests

a) Permissible radial load on the rod end

According to the type of load, it is indispensable to check the permissible stress.

Considering the same nominal load, dynamic loads produce greater stress on the rod end than constant loads; it is therefore necessary to introduce the coefficient K_f in the calculation of the permissible radial stress:

$$Fr_{amm.} = Co \times K_f$$

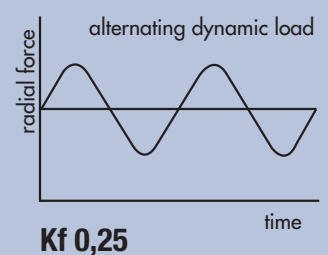

$Fr_{amm.}$ = maximum permissible load on the rod end (daN)

Co = permissible radial static load on the rod end (daN)

K_f = load coefficient (see the diagrams)

Fr = radial force applied (daN)

It is always important to verify the following condition: $Fr \leq Fr_{amm}$

b) Permissible axial load on the rod end

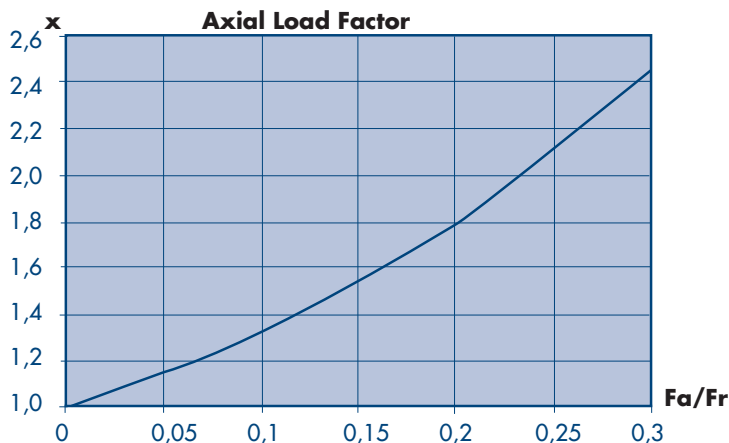

Normally there are no dynamic axial loads, so the conditions to be observed are the ones given in the paragraph on static axial loads on page 9.

c) Equivalent load allowed

If both types of load, axial and radial, are applied to rod ends or spherical bearings, the equivalent load P will be calculated by the formula:

$$P = Fr \cdot X$$

- P** = equivalent load (daN)
- Fr** = radial load (daN)
- Fa** = axial load (daN)
- X** = axial load factor determined by the graph

d) Specific pressure p allowed:

The specific pressure is the one detected between the inner ring and the surface on which it slides.

$$p = \frac{P}{dk \cdot C1}$$

- p** = specific pressure (daN/mm²)
- P** = equivalent load applied (daN)
- dk** = external diameter of the inner ring (mm)
- C1** = outer ring thickness (mm)

Check that the specific pressure allowed is included within the limits indicated on table 2

e) Sliding speed allowed:

The average sliding speed is the one detected between the inner ring and the surface on which it slides.

$$v = \frac{2 \cdot \pi \cdot \beta \cdot f \cdot dk}{180.000}$$

- v** = average sliding speed (m/min)
- β** = semi-angle of oscillation (°)
for complete rotation it is considered β = 90°
- f** = oscillations frequency or number of revolutions (min⁻¹)

Check that the sliding speed allowed is included within the limits indicated on table 2

f) Permissible pv factor:

$$pv = p \cdot v$$

p = specific pressure (daN/mm²)

v = average sliding speed (m/min)

Check that the permissible sliding speed falls within the limits indicated in table 2.

Coupling	P max (daN/mm ²)	v max (m/min)	p.v max. (daN/mm ² •m/min)
Steel on sintered bronze	5	30	4
Steel on sintered steel	7	20	3
steel on PTFE	10	20	2,5

Table 2

It is important to point out that the above safety coefficients have been calculated on the basis of the standard use of the units. Where heavier use is made (with strong pulsating loads or compound stresses) or where the personal safety is at risk, it is essential to employ greater safety factors to reduce stress and where necessary practical tests corresponding to the real use should be carried out, in order to analyse the actual durability.

In case of these special applications we can take no responsibility for the product since we are unable to foresee the actual use to which it will be put.

g) Operating temperature

The operating temperatures of rod ends and spherical bearings are the following ones:

Coupling	Temperature °C	Max. temperature °C
Steel on sintered bronze	-30° a +120°	+150°
Steel on sintered steel	-30° a +120°	+150°
steel on PTFE	-40° a +200°	+250°

Remark: in case of high temperatures, the life of the rod end/spherical bearing will be reduced.

3. CRITERIA OF USE

Rod ends and spherical bearings are products, that do not need any kind of maintenance before or during operation. As precision components they maintain their performances unchanged only if the following criteria are observed:

- > keep them in their original packaging and stored them in a suitable place;
- > during assembly avoid that foreign bodies might get between the inner and the outer ring;
- > do not stress the outer ring during assembly/disassembly and do not put it in contact with any other parts outside the joint itself during working;
- > avoid shocks or damages during assembly.

Use of spherical bearings

It is essential that the assembly is made by following precise rules:

- > To make easier the assembly, the end of the shaft and the one of the housing should present a chamfer with an angle between 10° and 20°;
- > It is recommended to assemble the joint with a suitable bush (or tube) which sticks to the entire surface of the outer ring (fig.1); however, direct blows to the spherical bearings should be avoided.
- > In assembling the housing and the shaft, it is of primary importance to pay careful attention to the precision of the tolerances and to errors of form.

The chamfers of the shaft r1 and of the housing r2 should be inferior to those ones of the joint indicated on the dimensional tables (r1s and r2s respectively) (fig.1).

The choice of the coupling should not be made by chance, since a too much high interference may cancel the radial play between the outer and the inner ring, considerably increasing the friction and so compromising the spherical bearing's life. On the other hand, a loose coupling would cause a deformation of the outer ring, reducing its duration.

Therefore, the tolerances of the below mentioned table should be strictly followed:

LOAD TYPE	HOUSING	SHAFT
NORMAL	M7	m6
STRONG	N7	m6

TYPE	Inner ring hole d		radial clearance (μm)	
	Over (mm)	Up to (mm)	min.	max.
TESNO® SPK - SPKX	3	6	30	70
	6	10	40	80
	10	18	45	90
	18	30	50	100
	30	50	--	--

NOTE WELL: the axial clearance is approx. 3-5 times the radial clearance

The radial clearance of the spherical bearing may vary according to the interference of the spherical bearing into its body. Therefore it is assembled with an oversize clearance so as to obtain the correct one.

6. PROTECTION OF ROD ENDS

PTS RUBBER COVERS (MADE OF NEOPRENE)

The protection allows the rod ends to be protected against dust, corrosive, chemical and atmospheric agents, etc...

Good resistance against oil, grease, chemical agents, salt spray.

It is not recommended for applications constantly in contact with oxidative agents and when the inner ring is subjected to complete revolutions or in case of high oscillating angle and anyway in case of high speeds.

Material: black Neoprene resistant from -30°C to $+120^{\circ}\text{C}$

DTS RINGS FOR RUBBER COVERS

Material: Nickel plated steel

For the mounting you can use a pair of pinchers suitable for the fixing of circlips (see picture)

ATS PROTECTION RINGS

These side protections guarantee a longer life of the rod end, since they keep dust and dirt away from the inner and outer ring.

It is possible to use them even in case of complete revolutions of the inner ring.

Material: vulcanized rubber on stainless steel ring.

Threaded pin:

automatic steel 11 SMnPb30 (1.0718 EN ISO 4042, Fe/Zn 8c 1B) galvanized surface by passivation free from hexavalent chromium. In alternative stainless steel XCrNi1810 (1.4301 - AISI 304)

SELF-LUBRICATING ROD ENDS

chiavette unificate

PRODUCT DESCRIPTION

The TESCUBAL® rod ends and spherical bearings are high resistance and precision products, which are made according to ISO 12240-4 K series and ISO 12240-1 K series.

They are maintenance free and employ a coupling of metal (inner ring) on sintered metal (outer ring) impregnated with a high potency lubricating fluid, which guarantees a constant lubrication.

The outer ring is cold formed on the inner ring, in order to guarantee a 100% surface contact, so that it can resist high loads and speeds, keeping the right lubrication during operation.

The main advantages of this product are:

- > Maintenance free operation, high load capacity and a reduced wear during operation, thanks to the metal/metal coupling and an appropriate and constant lubrication (our products don't need any maintenance even during the start)
- > Limited values of resistant couple which remain constant with time and an absence of stick-slip guaranteed by the lubricating fluid between the bush and the ball which ensures a low coefficient of friction
- > products are capable of functioning in the presence of or when immersed in oil
- > particularly suitable in case of oscillation movements, complete revolutions, high speeds...

Rod ends TOP version CF - CM series

Coupling: steel on bronze maintenance free

Support: from size 5 to size 12 are produced in automatic steel 11SMnPb30/37 (1.0718), successive sizes in forged, tempered steel C40 (1.1186)

Inner ring: tempered, ground and polished steel for bearings 100 Cr6 (1.3505)

Outer ring: sintered bronze impregnated with high-potency lubricating fluid, formed cold on the ball.

Rod ends OK version CF OK - CM OK series

Coupling: steel on steel maintenance free

Support: from size 5 to size 12 are produced in automatic, successive sizes in forged, tempered steel

Inner ring: tempered, ground and polished steel for bearings 34Cr4 (1.7033)

Outer ring: sintered steel impregnated with high-potency lubricating fluid, formed cold on the ball.

Rod ends STAINLESS STEEL version CFX - CMX series

Coupling: stainless steel on bronze maintenance free

Support: stainless steel X 5CrNi1810 (1.4301 – AISI 304)

Inner ring: tempered, ground and polished stainless steel X46Cr13 (1.4034 – AISI 420),

Outer ring: sintered bronze impregnated with high-potency lubricating fluid, formed cold on the ball.

Spherical bearings TOP version - SB series

Coupling: steel on steel maintenance free

Inner ring: tempered, ground and polished steel for bearings 100 Cr6 (1.3505)

Outer ring: sintered bronze impregnated with high-potency lubricating fluid, formed cold on the ball and grinded on the external diameter.

Spherical bearings OK version - SB OK series

Coupling: steel on steel maintenance free

Inner ring: tempered, ground and polished steel for bearings 34Cr4 (1.7033)

Outer ring: sintered steel impregnated with high-potency lubricating fluid, formed cold on the ball and grinded on the external diameter.

SELF-LUBRICATING SPHERICAL BEARINGS
OK Version

PRODUCT DESCRIPTION

The **TESNO®** rod ends and spherical bearings are high quality products and are made according to ISO 12240-4 K series and ISO 12240-1 K series respectively.

They are maintenance free and employ coupling of metal (inner ring) on PTFE (bonded to the inner surface of the outer ring), which guarantees the lubrication during the operation.

The bronze outer ring containing the PTFE liner is cold formed on the inner ring.

The main advantages of this product are:

- › High loads and maintenance free
- › Suitable in case of small pivoting angles, dynamic load peaks and movements with a low friction coefficient

Rod ends STANDARD version CFP - CMP series

Coupling: steel on PTFE liner, maintenance free

Support: from size 5 to size 12 are produced in automatic steel 11SMnPb30/37 (1.0718), successive sizes in forged, tempered steel C40 (1.1186). Zinc plated surface (EN ISO 4042 Fe/Zn 8c 1B)

Inner ring: tempered, ground and polished steel for bearings 100 Cr6 (1.3505)

Outer ring: brass with PTFE bonded on the inner surface.

Rod ends STAINLESS STEEL version CFPX - CMPX series

Coupling: steel on PTFE liner, maintenance free

Support: stainless steel X 5CrNi1810 (1.4301 – AISI 304)

Inner ring: tempered, ground and polished stainless steel X46Cr13 (1.4034 – AISI 420)

Outer ring: stainless steel X 5CrNi1810 (1.4301 – AISI 304) with PTFE bonded on the inner surface.

Rod ends ERGAL version CFE - CME series

Coupling: steel on PTFE liner, maintenance free

Support: ERGAL (7075 alloy state T6) with anodized surface

Inner ring: tempered, ground and polished steel for bearings 100 Cr6 (1.3505)

Outer ring: carbon steel C45 (1.1191) with PTFE bonded on the inner surface.

Rod ends ERGAL and STAINLESS STEEL version CFE - CMEX series

Coupling: stainless steel on PTFE liner, maintenance free

Support: ERGAL (7075 alloy state T6) with anodized surface

Inner ring: tempered, ground and polished stainless steel X46Cr13 (1.4034 – AISI 420)

Outer ring: stainless steel X 5CrNi1810 (1.4301 – AISI 304) with PTFE bonded on the inner surface.

Spherical bearings STANDARD version SPK series

Coupling: steel on PTFE liner maintenance free

Inner ring: tempered, ground and polished steel for bearings 100 Cr6 (1.3505)

Outer ring: carbon steel C45 (1.1191) with PTFE bonded on the inner surface.

Spherical bearings STAINLESS STEEL version SPKX series

Coupling: stainless steel on PTFE liner maintenance free

Inner ring: tempered, ground and polished stainless steel X46Cr13 (1.4034 – AISI 420)

Outer ring: stainless steel X 5CrNi1810 (1.4301 – AISI 304) with PTFE bonded on the inner surface.

DIN ISO 12240-4 Series K Female thread

Coupling: steel/PTFE

Application: precision engineering

 Technical reading from page 9 to page 15

MATERIAL

Support:

Up to size 12 automatic steel 1.1SMnPb30 (1.0718)
 from size 14 hardened and tempered steel C40 (1.1186),
 galvanized surface by passivation free from hexavalent
 chromium (EN ISO 4042, Fe/Zn 8c 1B)

Inner ring:

tempered, ground and
 polished steel for bearings
 100 Cr6 (1.3505)

Outer ring:

brass and PTFE
 bonded on the inner
 surface

DIN ISO 12240-4 Series K Female thread

Coupling: stainless steel/PTFE

Application: precision engineering, suitable for oxidizing and corrosive environments

Dimensions mm

chiavette unificate

1. PRODUCT DESCRIPTION

Clevises are mechanical linking units suitable for the transmission of static forces. The pins or the lockable pins, used in conjunction with the clevises, have the function of connecting the clevis with the mechanical part for the transmission of the force. They are standard products, which are produced according to the norms and the indicated dimensional tables. All our products can be supplied galvanized or unplated.

2. TECHNICAL DATA

- Clevis type G DIN 71752 norm
- Clevis type G . . FG DIN 71752 norm with thread ISO 8140
- Clevis type G . . CN t CNOMO 06 07 14 norm
- Mating piece for clevis type G . . FG according to dimensional tables
- Pin type PDIN DIN 1434 norm
- Pin type PKS according to dimensional tables
- Pin type PI according to dimensional tables
- Pin type PC according to dimensional tables

Material: Automatic Steel 11SMnPb30 (1.0718) COLD-DRAWN (+C) EN 10277-3 NORM

- Clevis type G . . STAINLESS STEEL DIN 71752 norm
- Clevis type G . . FG STAINLESS STEEL DIN 71752 norm with thread ISO 8140
- Mating piece for clevis type G . . FG STAINLESS STEEL according to dimensional tables
- Pin type PI . . STAINLESS STEEL according to dimensional tables

Material: Stainless Steel AISI 303 (1,4305) COLD-DRAWN (+C) EN 10088-3 NORM

- Clevis type GA . . DIN 71752 norm
- Clevis type GA . . FG DIN 71752 norm with thread ISO 8140
- Pin type PKSAL . . according to dimensional tables

Material: Aluminium 2011 (11S) anodized COLD-DRAWN EN 754 NORM

- Lockable pin type PM according to dimensional tables
- Lockable pins type PMC according to dimensional tables

Material: Pin - automatic steel 11SMnPb30 (1,0718)

Material: Spring - carbon steel C67 (1,0603)

Static load

By static load we mean the maximum radial load which, when applied to the forks in a static way, does not create permanent deformations or prejudice its functioning.

The values of the maximum permissible load were obtained by calculation and then verified on significant samples taken from our production series.

In the tables of dimensions the permissible static loads (C_o) which are indicated have been calculated on the basis of a minimum safety factor of 2.5 times with respect to the breaking static load.

Where pulsating or alternating loads are used, it is necessary to reduce the permissible static load introducing the safety coefficient K_f :

$$Fr \text{ amm.} = C_o \times K_f$$

- Fr amm.** = maximum permissible load on the fork (daN)
- C_o** = permissible radial static load on the fork (daN)
- K_f** = load coefficient
- Fr** = radial force applied (daN)

It is important always to verify the following condition:

3. TOLERANCES

The constructional tolerances refer to current regulations or to those specified in the tables of dimensions.

DIN 71752

Dimensions mm

For left-hand thread add "LH" (ex. G16x32 LH)
 Technical reading from page 44 to page 45

MATERIAL

automatic steel 11SMnPb30 (1.0718)

Surface protection:

- Zinc plating according to EN ISO 4042, Fe/Zn 8c...
- Chromate treatment (passivation) example: type A please add 1A (G20x40 1A)
- Surface treatment table at page 6
- Without any indication, the clevis will be supplied oiled and unplated

Tolerances:

The dimensional tolerances shown in the table make reference to zinc plated products.

CLEVIS ACCESSORIES

chiavette unificate

1. PRODUCT DESCRIPTION

Ball joints are mechanical units for the connection of 2 parts which are perpendicular with respect to each other. They enable the transmission of alternating forces through angular and oscillating movements, at a moderate speed.

They are standard products which are produced according to the following standards:

DIN 71802

Ball joints:

a) Form C: without safety clip S and therefore without its external slot and the two holes for the clip itself

b) Form CS: with safety clip S mounted in the slot and the two holes of the housing.

Available with or without nut (mounted or separated)

DIN 71805

Ball Socket

a) Form A: without slot and holes for the safety clip and with the mounted snap ring R

b) Form B: with external slot and holes for the safety clip S and with the internal snap ring R

DIN 71803

Ball Stud

a) Form C: with thread

b) Form B: without thread, to rivet

The ball sockets DIN 71805 produced and supplied by Chiavette Unificate have been improved by the spanner's execution. Upon request, they could be also supplied without spanner surface

All our products could be supplied with electrolytic coatings according to the standards stated at page 6 and/or unfinished.

2. TECHNICAL DATA

MATERIALS

Ball stud: carbon steel with 60 daN/mm² resistance to tensile stress and inner ring hardened on the surface with hardness ≥ 52 HRC in alternative (1.4305 - AISI 303)

Ball socket: steel 11SMnPb30 with a 50 daN/mm² resistance to tensile stress (1.0718) in alternative (1.4305 - AISI 303)

Springs: steel for springs C98 UNI EN 10270-1 DH in alternative (1.4319 - AISI 302)

Lubrication: spherical coupling loaded during assembly with LITHIUM grease, NLGI 1 grade

Nuts: see table at page 67

Extraction and Insertion force BALL STUD - BALL SOCKET

The load values requested for the extraction and insertion of the ball stud from/to the ball socket's housing with the mounted "R" spring, with the joint free from grease, are indicated in the following table:

d1 (ball stud inner ring diameter)	8	10	13	16	19
Extraction force [daN] min	3	4	6	8	10
Insertion force [daN] max	20	25	32	35	40

Sliding moment

In the male-female coupling (with grease), the male in a horizontal position falls with a force F applied to the extremity of the male thread (see diagram), according to the table below:

DESIGNATION	max. force (daN)
C 8 M5	0,4
CS 8 M5	0,4
C 10 M6	0,5
CS 10 M6	0,5
C 13 M8	0,6
CS 13 M8	0,6

CS 16 M10 - M12	0,7
C 19 M14 - M16	0,8
CS 19 M14 - M16	0,8

Permissible load and tightening torque

The maximum permissible load for the angular joint is given in the following table; it is also important to tighten the nut as indicated:

DESIGNATION	Permissible load [daN]		Nut tightening torque (daN·m)
	static	dynamic	
C 8 M5	50	20	0,35
CS 8 M5	50	20	0,35

MATERIAL

Ball stud: carbon steel with a 60 daN/mm² resistance to tensile stress and inner ring hardened on the surface with a ≥ 52 HRC hardness

Surface protection:

- Zinc plating according to EN ISO 4042, Fe/Zn 8c...
- Example of chromate treatment (passivation): type A please add 1A (ex.: C8 M5 1A)
- Surface treatment table at page 6

Tolerances:

The dimensional tolerances in the table make reference to zinc plated products.

PRODUCT DESCRIPTION AND TECH. DATA

Feather keys according to DIN 6885- UNI 6604 (former ISO 773)

Feather keys are normally used to transmit the torque from the shaft to the hub

Nomenclature according to the standard:			DESCRIPTION
UNI 6604	UNI 6605	DIN 6885	
Form A		Form A	rounded ends
Form B		Form B	flat ends
	Execution I	Form C	From section 8x7 form A supplied with hole for retaining screw
		Form D	From section 8x7 form B supplied with hole for retaining screw
	Execution II	Form E	From section 8x7 to 10x8 form A supplied with 2 holes for retaining screws
		Form F	From section 8x7 to 10x8 form B supplied with 2 holes for retaining screws
	Execution III	Form E	From section 12x8 form A supplied with 2 holes for retaining screws and 1 threaded hole for the extracting screw
		Form F	From section 12x8 form B supplied with 2 holes for retaining screws and 1 threaded hole for the extracting screw
	Execution IV	Form G	From section 8x7 form B supplied with hole for retaining screw and chamfer
	Execution V	Form H	From section 8x7 form B supplied with 2 holes for retaining screw and chamfer
	Execution VI	Form J	From section 8x7 form B supplied with chamfer and hole for 1 spring dewel sleeve
Form A/B: not included in the standard			if needed the forms A and B can be combined, so that 1 end will be flat and the other one will be rounded

MATERIAL

C45 (1.1191) steel with $R_{\geq 59}$ daN/mm² cold formed according to EN ISO 683-1 : 2018
 stainless steel (1.4401 - AISI 316) with $R_{\geq 59}$ daN/mm² - cold formed 39NiCrMo3 (1.6511) available upon request up to size 20x12 mm and 18NiCrMo5 (1.5919) up to size 12x8 mm.

The relationship between the diameter of the shaft and the section of the key indicated in the dimensional tables refers to normal uses

The use of keys with smaller sections is possible if their resistance is sufficient for the force to be transmitted

The use of keys with larger sections is not recommended.

MATERIAL

steel C45 (1.1191) with $R_z \geq 59 \text{ daN/mm}^2$ cold drawn EN ISO 683-1 : 2018 norm

The relation between the shaft diameter and the key section, indicated in the dimensional tables, is referred to the standard use

It is possible to use smaller keys sections, if their resistance is enough for the torque to be transmitted

The use of keys with bigger sections is not recommended

Dimensional tolerances of the keyway for the woodruff keys according to ISO 3912 DIN 6888 UNI 6606

Note: mass volume 7,85 kg/mm³

Technical reading from page 89 to page 90

WOODRUFF KEYS

chiavette unificate

Shims

MATERIAL

Hardening and tempering steel or casehardening steel

THICKNESS

from 0,8 mm to 5,00 mm

MACHINING

Blanking, turning, heat treatments, grinding, polishing...

Thickness tolerances up to $\pm 0,01$ mm

Special identification of the components by paint or laser mark available

Our specialization consists in realizing products taken from the client drawings, that need blanking, turning, heat treatments, grinding, polishing, eventual laser mark and/or paint job for recognition of job.

Rod assemblies and special components

In special production, you can get the desired product, thanks to the specialisation of qualified personnel.

This consists in making products to design, which require blanking, milling, heat treatment, grinding, polishing, eventually marking and assembly.

SPECIAL PRODUCTS AND ACCORDING TO DRAWINGS
